Acabidopsis thallana BAC T32N15 from chromosome III near 54 cM Sequencing, analysis, and annotation were performed in collaboration with the CSHL/WU/ABI Arabidopsis Sequencing consortium. Information on physical mapping, YAC and BAC library construction, and a more detailed annotation of the seqence can be viewed at http://www.cshl.org/arabweb/. Gene prediction programs Grail and MZEF were used in the assembly of coding regions. In certain regions of the BAC these exons are not incorporated into a good model gene and are thus annotated as single exons. BAC T32N15 has been mapped to ofromosome III near 54 cM and marker m249. A graphical display of the annotation of T32N15 can be found at http://www.cshl.org/arabweb/T32N15-titlepage.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  7559. 3750
Anote-"function-putative MITES; region is 96.9% identical to the nucleotide sequence of A. thaliana BAC T7N9, GenBank accession number AC000348; although GRAIL predicts an exon from position 3620 to 3759 and translation of this earn are in a manual programs fail to protein T7N9.14; gene-prediction programs fail to assemble this entire exon into an MRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /rpt_type=dispersed

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Maize histone

```
CC The present sequence encodes an Arabidopsis thaliana histone deacetylase CC designated AthDA2A. The protein is homologous to yeast RPD3 and HDA1. CC The polynucleotide sequence is used in the method of the invention. CC The specification describes a method for regulating gene expression in CC transgenic plants. The method comprises modifying histones by introducing chimeric nucleotide sequences which have regulatory elements in operative CC eassociation with a gene of interest or with a nucleotide sequence CC encoding histone deacetylase. The method is useful for regulating the developmental, physiological or biochemical pathway within a plant, CC particularly for repressing ethylene-responsive phenotypes (e.g. inhibition of hypocotyl elongation). The method is also useful CC as a functional test for identifying a phenotype associated with CC perturbing a gene. The histone deacetylase genes are useful for altering the development of an organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The present sequence encodes an Arabidopsis thaliana histone deacetylase designated AtHDA2B. The protein is homologous to yeast RPD3 and HDA1. The polynucleotide sequence is used in the method of the invention. The specification describes a method for regulating gene expression in transgenic plants. The method comprises modifying histones by introducing chimeric nucleotide sequences which have regulatory elements in operative association with a gene of interest or with a nucleotide sequence encoding histone deacetylase. The method is useful for regulating the developmental, physiological or biochemical pathway within a plant,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Methods for regulating gene expression in transgenic plants, e.g. repressing ethylene-responsive phenotypes (e.g. inhibition of hypocotyl elongation), comprises introducing genes encoding histone deacetylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Histone deacetylase; AtHDA2B; RPD3; gene expression; transgenic plant; HDA1; ethylene-responsive phenotype; hypocotyl elongation; ds.

particularly for repressing ethylene-responsive phenotypes (e.g. inhibition of hypocotyl elongation). The method is also useful as a functional test for identifying a phenotype associated with perturbing a gene. The histone deacetylase genes are useful for altering the development of an organism.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence encodes a malze histone deacetylase. This DNA belongs to family 2, ZmHD2 and appears to affect chromatin structure at promoters of RNA polymerase I and thus regulate ribosomal RNA production. The nucleotide sequence can be used to transform plants and increase chromatin assembly, and gene activity of the transformed plants chromatin assembly, compositions find use in screening for toxins that affect pathogenicity and in determining which disease response promoters are

Maize histone deacetylase; family 2, ZmHD2; chromatin structure; Mak polymerase I; ribosomal RNA production; promoter requiator; promoter; transcription; plant transformation; heterochromatin; disease resistance; chromatin assembly; gene activity; toxin screening; pathogenicity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence encodes a maize histone deacetylase . This DNA belongs to family 2, muhD2 and appears to affect chromatern structure at promoters of RNA polymerase I and thus requiate ribosomal RNA production. The nucleotide sequence can be used to transform plants and increase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    used for producing transgenic plants which have

disease resistance by altering the levels of heterochromatin, altering chromatin assembly, and gene activity of the transformed plants. Additionally, compositions find use in screening for toxins that affect pathogenicity and in determining which disease response promoters are regulated by histone deacetylase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            375

The present sequence encodes a maize histone deacetylase . This DNA belongs to family 2, ZmHD2 and appears to affect chromatin structure at promoters of RNA polymerase I and thus regulate ribosomal RNA production. The nucleotide sequence can be used to transform plants and increase disease resistance by altering the levels of heterochromatin, altering chromatin assembly, and gene activity of the transformed plants. Additionally, compositions find use in screening for toxins that affect pathogenicity and in determining which disease response promoters are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes a malze histone deacetylase. This DNA belongs to family 2, ZmiD2 and appears to affect chromatin structure at promoters of RNA polymerase I and thus regulate ribosomal RNA production. The nucleotide sequence can be used to transform plants and increase disease resistance by altering the levels of heterochromatin, altering chromatin assembly, and gene activity of the transformed plants. Additionally, compositions find use in screening for toxins that affect pathogenicity and in determining which disease response promoters are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             used for producing transgenic plants which have

Pred. Mo. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/note="Vector: lambda Zip-Lox; Site_l: Sal; Site_2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and silqques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA. " 17 others
